## Current Research interests

1. Design of novel bioactive compounds using Nuclear Magnetic Resonance (NMR) Spectroscopy and *in silico* applications. Proteins of interest include: (i) Lanosterol 14 alpha-demethylase for the design of novel antifungal agents; (ii) AT<sub>1</sub> receptor towards the design of novel Angiotensin II antagonists for the regulation of blood pressure; (iii) tyrosinase enzyme towards novel inhibitors with applications in cosmetics.

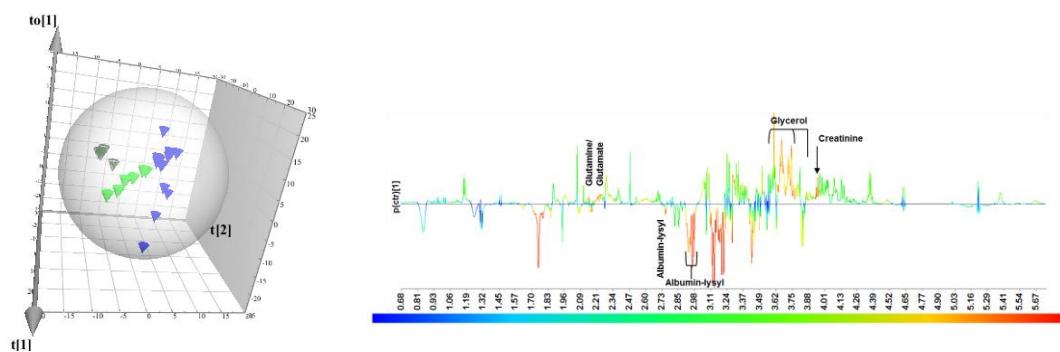

*Binding of Angiotensin II provides insights into AT<sub>1</sub> receptor activation.*

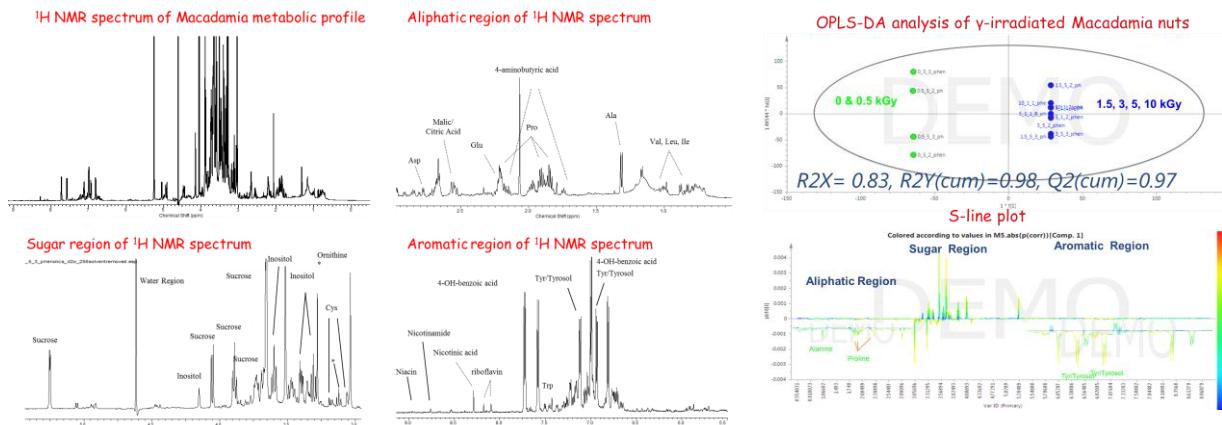

*Virtual screening of compound libraries for CYP51. Proposed hits bind close to heme ring chelating the metal cation.*

2. NMR based metabolomics towards novel biomarkers for early diagnosis. This is a recent field of interest currently targeting the embryometabolomics area correlating between biomarkers found in blood and human amniotic fluid with fetal malformations, preterm delivery as well as embryo growth and viability in *in-vitro* fertilization.

*O2PLSDA model of maternal blood serum samples classify the large for gestational age (LGA) (green), the LGA from diabetic mothers (grey) and the appropriate for gestational age (AGA) (blue) samples according to their metabolic fingerprint.*

3. Identification of bioactive compounds in food products using high energy (ultrasound and microwave assisted extraction), NMR and HR LC-MS techniques. One of the main objectives is the development of a detection methodology for gamma irradiated food, based on NMR applications.

$^1\text{H}$  NMR spectra of lipid extract of macadamia nuts after 10kGy of  $^{60}\text{Co}$  gamma irradiation.

Untargeted analysis of lipid profile data can be used to discriminate irradiated samples at certain doses.
